Three Level Rectifier &
Inverter Technology
Ultra High Energy Efficiency

real source of power

- True Three Level Rectifier & Inverter Technology
- Output Power Factor 1 (kVA=KW)
- On Line-Double Conversion Technology (Class VFI-SS-111)
- IGBT PWM Rectifier & Inverter Technology
- DSP Control
- Ultra High Efficiency up to 96%
- Low Input Current THD (<3%)
- High Input Power Factor (>0.99)
- Dual Input
- Optional DC/DC Charger/Booster
- Wide Input Voltage Range (Optional)
- Advanced Battery Management
- Short Circuit and Overload Protection
- Paralellable Modules up to 8 units
- 500 Real Time Event Log with Detailed Parameters
- Static&Manual Bypass Operation
- Overload and Short Circuit Protection
- Small Footprint and Easy Maintenance
- Advanced Communication Capabilities
- Perfect Generator Compatibility

Greater Power Higher Efficiency

LevelUps Series uninterruptible power supply (UPS) with Innovative 3 Level Technology is a true on-line double conversion, three-phase UPS system that provides one of the highest level energy efficiencies in the industry.

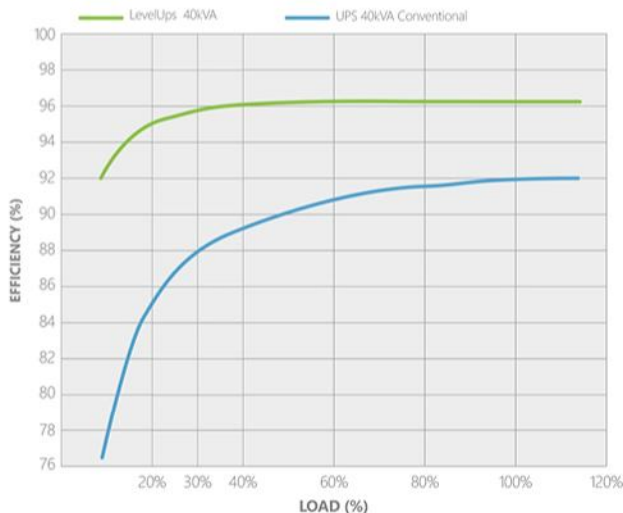

Three Level UPS Series

With its latest Three level inverter & rectifier design LevelUps Series brings the newest power conversion technology and delivers efficiency up to 96% at 50-75% load operation which is the most common operating range. This ultra high system efficiency provides considerable cost savings in comparison to the traditional transformerless Ups's with 93% efficiency.

High Efficiency & Low Total Cost of Ownership

LevelUps Series consumes less energy to supply the loads thanks to its high efficiency up to 96%. High Efficiency rate provides ;

- Reduced energy loss
- Reduced electricity usage and air conditioning requirements
- Reduction in operating cost of Ups

DSP Power Factor Corrected IGBT Rectifier

IGBT based power factor correction technology provides Input Power Factor close to 1 (≥ 0.99) and keeps Input Current Total Harmonic Distortion (THDi) less than 3%, that helps to avoid the disturbance.

Digital Control System

All of the control functions for LevelUps Series UPS including power-on, start-up control, input stage power factor control, battery charging and boosting control, output stage ac voltage regulation and shut-down control, can be realized by using a single DSP control board.

Low Input Current THD

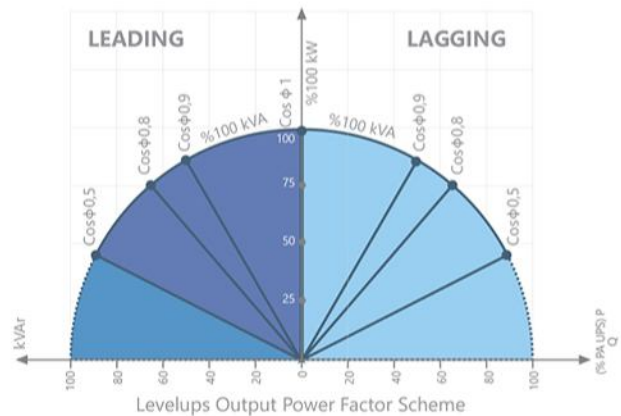

(THDi) less than 3% avoids the disturbance to connected loads.

High Input Power Factor

0.99 Input power factor ensures clean and sinusoidal input current. The high input power leads to reduced electricity pay-out, minimizes cable, switchboard, fuse and generator requirements, thus reducing investment cost.

High Output Power Factor 1

Output Power factor of 1 (kVA=kW) rate provides up to 25% more active power than a traditional UPS. Suitable for modern power supply application with unit or capacitive power factor (e.g. new servers generation) without any reduction in active power from 1 leading to 1 lagging.

Dual Input Operation

LevelUps Series can operate with either single or dual power inputs. Dual Input feature increases availability by allowing UPS to be connected to two separate power sources. In dual configuration the rectifier is fed from utility (main source) and the static and maintenance by-pass are fed from a secondary source.

Advanced Battery Management

LevelUps Series guarantees enhanced battery life and maximizes battery performance, life span and reliability through intelligent precision charging. Temperature Compensated Battery Charging monitors performing measurement of external and internal battery temperature and adjusting the charge current rate accordingly.

Advanced battery management provides real-time information about battery capacity and back up time, this information can be seen on LCD panel. The Ups tests the batteries at adjustable periods without switching off the system, the test periods can be set by users.

EPO (Emergency Power Off)

EPO function is designed to switch off the UPS in emergency conditions (fire, flood, etc.). The system will turn off the rectifier, inverter and will stop powering the load immediately (including the inverter and bypass) also the battery stops charging or discharging.

Static & Manual (Maintenance) Bypass

LevelUps Series includes standard static and manual bypass. Static bypass provides safe failure to mains if the UPS is overloaded or develops a fault condition. Where EMI filters are used to help to neutralize spikes and electrical noise, the load may be routed through bypass to provide further protection. Manual bypass function is intended only for maintenance work, this bypass supply is incorporated into the LevelUps design. Manual bypass is used to power down the UPS without interrupting the power to the load. With this feature it is completely safe for the technical personnel to work on the faulty UPS.

Auto Restart

When the main and bypass sources fail, the UPS draws power from the battery system to supply the load until the batteries are depleted. When UPS will reach its end of discharge, it will shut down. The UPS will automatically restart and enable output power:

- After utility power is restored
- After the "Auto Start Delay Time" is expired (the default delay is 5 minutes).

Perfect Generator Compatibility

LevelUps Series is perfectly compatible with diverse sources, especially with generators. When generator power is used, thanks to its robust IGBT rectifier, it ensures clean, uninterrupted power to protected equipment. With high input power factor performance of LevelUps series it is enough to choose generator with power only %20 higher rated than the UPS. LevelUps Series has the ability to adjust power walk-in from 5 to 15 seconds, along with reduced input current distortion.

Reverse Energy Tolerance for Regenerative Loads

LevelUps can be used with regenerative loads, such as synchronous motors. The regenerative loads pump the energy back to mains, traditional Ups systems burn this feedback energy and this causes lower efficiency. LevelUps Series Ups with IGBT rectifier are able to absorb intermittent load generated power. Additionally, this reverse power tolerance permits execution of important system operations like closed transition transfers of the UPS load directly to an engine generator source.

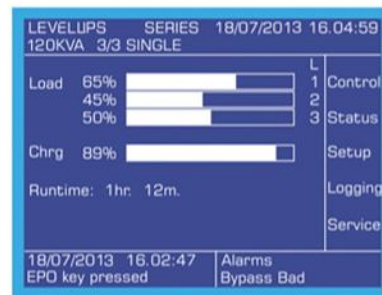

Flexibility

LevelUps is compatible with wide range of application. Flexibility achieved through many choices, including type of battery, single or multi-unit configuration, accessories and options.

- Frequency converter mode
- Optional temperature sensor for external battery cabinets (to assist the recharge voltage compensation)
- Additional battery chargers to optimize charge time
- Separated bypass
- Optional backfeed protection
- Isolation transformers to vary neutral connectivity in the event of separate power sources or for galvanic isolation between input and output
- Battery cabinets of different sizes and capacities, for providing extended runtimes.

Advanced User Interface

LevelUps has Large and user-friendly 320x240 touch panel LCD display that provides operating information in four different languages. Thanks to this advanced touch panel LCD display all parameters of working device can be monitored and controlled. UPS is capable of recording up to 500 events.

Parallel Operation

LevelUps Series features easy and simple scalability and redundancy. It is ready to grow with your business demands. Different power rated units and any number of UPS can be connected in parallel.

Power Increase: The UPS's can be connected in parallel to increase total capacity of the system. If one of the devices goes out of order, the critical loads are transferred to by-pass.

Parallel Operation Features :

- Internal standard parallel microprocessor for all models.
- Up to 8 units paralleable
- Parallel connection with ring cable
- Optional Loop BUS connection
- Autosensing disconnected parallel cable
- Equal current share with DSP control
- Easy power upgrade without any interruption
- All parallel systems can be controlled from the front panel of one unit
- Full synchronization of parallel units
- Isolated parallel operation card
- Static by-pass for all units
